

you are an expert in synthetic data generation task. you can generate various data points from a given sample distribution of data. It is important for you to generate the data that belongs to the similar distribution as of the sample distribution.

When making a suggestion, you break things down in to discrete changes. Finally, you produce correct outputs that provide the right balance between solving the immediate problem and remaining generic and flexible.

You always ask for clarifications if anything is unclear or ambiguous. You stop to discuss trade-offs and implementation options if there are choices to make.

It is important that you follow this approach, and do your best to teach your interlocutor about making effective decisions. You avoid apologising unnecessarily, and review the conversation to never repeat earlier mistakes.

i am trying to help user navigate through the product buying journey. the journey has several steps which are disguised as the nodes in a graph. user can jump from one node to another in bi direction manner from all the nodes.

The nodes are nodes = { "Home Page": 0, "Bike Models Overview":1, "Specific Bike Model Page":2, "Build & Customize":3, "Compare Models":4, "Find a Dealer":5, "Request a Quote":6, "Check Financing Options":7, "Schedule a Test Ride":8, "Customer Reviews":9, "Accessory Shop":10, "Service & Maintenance Info":11, "User Account Login/Registration":12, "Contact Support":13, "Promotions & Offers":14, "Blog/News/Updates":15, "Events & Community":16, "Bike Registration":17, "Bike Insurance Information":18, "FAQ/Help Center":19 }

i have classified the nodes in 5 different classes of a marketing model. The classes and the corresponding nodes are given below.

Awareness : Home Page (0), Blog/News/Updates (15), Events & Community (16)
Consideration: Bike Models Overview (1), Specific Bike Model Page (2), Compare Models (4), Customer Reviews (9), FAQ/Help Center (19)
Decision: Build & Customize (3), Find a Dealer (5), Request a Quote (6), Check Financing Options (7), Schedule a

Test Ride (8), Promotions & Offers (14) Purchase: Accessory Shop (10), User Account Login/Registration (12) Post-Purchase: Service & Maintenance Info (11), Contact Support (13), Bike Registration (17), Bike Insurance Information (18).

I want you to give emphasis to 4 different aspects of the data while generating chat conversation.

Aspect 1: General path of progression of user journey

if user has not decided anything then he is currently on one of the awareness node where he just got to know about the cars and he wants to buy one. At this point you might ask about the budget or any other specifications they have in mind for bikes.

if user has selected few companies or the car models and confused among them then he is in consideration stage where he needs more clarity towards buying car.

if user is confused about the car companies then you should take him to consideration part where you take him to models overview then to compare models then to specific model page then to customer reviews.

Aspect 2: How single chat conversation looks like

The whole history of chat for a particular user is considered as a single data point or single conversation. start the next conversation only when the whole user journey is completed and not on basis of the contextual classification. If you are suggesting the bike model then try to suggest more than one models.

Aspect 3: make conversation realistic by adding more context

include more context in chat for example asking the budget to those who have not decided anything and asking car specifications if some one is confused in different models or companies

Aspect 4: Combine generation of long and short conversation

There are some users who does not do much research before buying such as they directly go to overview page then find the model they like and then buy it or they might have a particular model in mind then directly buy it. on the other hand there are some users who does extensive research before buying for example such user go through mostly all the nodes in consideration desicion and purchase part of process. i want diversified dataset that consist of all the kinds of user who buys quickly with less chat conversation while others who want to visit all the nodes and takes ore chat conversation.

Aspect 5: keep in mind Users can decline your suggestion

there can be scenarios where user might decline to your more than one question but you should be persistent in making user move forward to the next node. and there are some users who never declines to what ever you say. so make a mixture of these kind of chats where there is no decline, one decline and more than one decline. if you get decline dont end cant there but keep moving.

Keep in mind not to decline every suggestion as it is not a realistic behavior.

#####

The sampel data point is given below. it is the chat between a chat bot and a user regarding buying a car.

Chatbot: Hi there! What brings you here today? **User:** I'm looking to buy a bike and need some help. **Chatbot:** Great! Let's start by exploring our bike models. What's your budget? **User:** Around 12 lakh rupees. **Chatbot:** Let's begin with models within your budget range. **Current Node:** Home Page (Awareness) **Next Node:** Bike Models Overview (Consideration)

Chatbot: Here are the models within your budget. Any specific features you're interested in? **User:** I'm looking for something with high fuel efficiency and good resale value. **Chatbot:** Let's compare the models based on fuel efficiency and resale value. **Current Node:** Bike Models Overview (Consideration) **Next Node:** Compare Models (Consideration)

Chatbot: Here are the comparisons. Would you like detailed information on any specific model? **User:** Yes, I'd like to know more about the Yamaha FZ-S. **Chatbot:** Let's look at the Yamaha FZ-S in detail. **Current Node:** Compare Models (Consideration) **Next Node:** Specific Bike Model Page (Consideration)

Chatbot: Here are the details for the Yamaha FZ-S. Would you like to see customer reviews? **User:** Yes, that would be helpful. **Chatbot:** Let's check out the customer reviews. **Current Node:** Specific Bike Model Page (Consideration) **Next Node:** Customer Reviews (Consideration)

Chatbot: Here are the reviews. Would you like to schedule a test ride? **User:** Yes, I'd like to try it out. **Chatbot:** Let's arrange a test ride for you. **Current Node:** Customer Reviews (Consideration) **Next Node:** Schedule a Test Ride (Decision)

Chatbot: Test ride scheduled! Would you like to check the financing options available for this model? **User:** Yes, that's important. **Chatbot:** Let's check the financing options. **Current Node:** Schedule a Test Ride (Decision) **Next Node:** Check Financing Options (Decision)

Chatbot: Here are the financing options. Would you like to request a quote for this bike? **User:** Yes, please. **Chatbot:** Let's proceed with the quote request. **Current Node:** Check Financing Options (Decision) **Next Node:** Request a Quote (Decision)

Chatbot: Your quote request is submitted. Would you like to create an account to track your preferences and decisions? **User:** Yes, that's useful. **Chatbot:** Let's proceed with User Account Login/Registration. **Current Node:** Request a Quote (Decision) **Next Node:** User Account Login/Registration (Purchase)

Chatbot: Account created! Would you like to check service and maintenance info?

User: Yes, I need to know about that too. **Chatbot:** Let's proceed to service and maintenance info. **Current Node:** User Account Login/Registration (Purchase) **Next Node:** Service & Maintenance Info (Post-Purchase)

Chatbot: Here is the service and maintenance information. Is there anything else I can help you with? **User:** No, that's all for now. Thanks! **Chatbot:** You're welcome! Have a great day!

This is example is provided to give you the idea of the format in which i need the chat to be generated. You can use your own intelligence to generate the data, no need to generate examples from this distribution

now using this information generate 15 chat conversations. in this conversations mention where the user is currently and what should be the next node user should go to.
